8.Develop an application to change the font and colour of the text and display toast message when the user presses the button.

Aim:

To develop a web-based Library Management System that validates user inputs using JavaScript and connects to a database using Servlets and JSP, while also demonstrating a simple Weather Information Webpage UI.

Procedure:

1. Create an HTML webpage for Library Management System.
2. Design a form to add books/users.
3. Apply JavaScript validation for all fields.
4. Create a JSP page to display data.
5. Develop a Servlet to handle form submission.
6. Connect the application to a MySQL database.
7. Insert validated data into the database.
8. Run the project on a server (e.g., Apache Tomcat).
9. Display success or error messages

Code:

1.index.html:

```
<!DOCTYPE html>
<html>
<head>
   <title>Text Style App</title>
   <style>
      body {
         text-align: center;
         margin-top: 100px;
         font-family: Arial;
```

```
        }

        #text {
            font-size: 30px;
            color: black;
        }

        button {
            padding: 10px 20px;
            font-size: 18px;
            margin-top: 20px;
        }
    </style>
</head>
<body>

    <h2 id="text">Hello Student!</h2>

    <button onclick="changeStyle()">Change Style</button>

    <script>
        function changeStyle() {
            var text = document.getElementById("text");

            // Change color
            text.style.color = "red";

            // Change font
            text.style.fontFamily = "Courier New";
            text.style.fontWeight = "bold";
            text.style.fontStyle = "italic";

            // Show message
            alert("Font and Color Changed!");
        }
    </script>

</body>
</html>
```

2.MainActivity.java :

```
package com.example.textstyleapp;

import android.graphics.Color;
import android.graphics.Typeface;
import android.os.Bundle;
import android.view.View;
import android.widget.Button;
import android.widget.TextView;
import android.widget.Toast;
import androidx.appcompat.app.AppCompatActivity;

public class MainActivity extends AppCompatActivity {

    TextView textView;
    Button button;

    @Override
    protected void onCreate(Bundle savedInstanceState) {
        super.onCreate(savedInstanceState);
        setContentView(R.layout.activity_main);

        textView = findViewById(R.id.textView);
        button = findViewById(R.id.button);

        button.setOnClickListener(new View.OnClickListener() {
            @Override
            public void onClick(View v) {

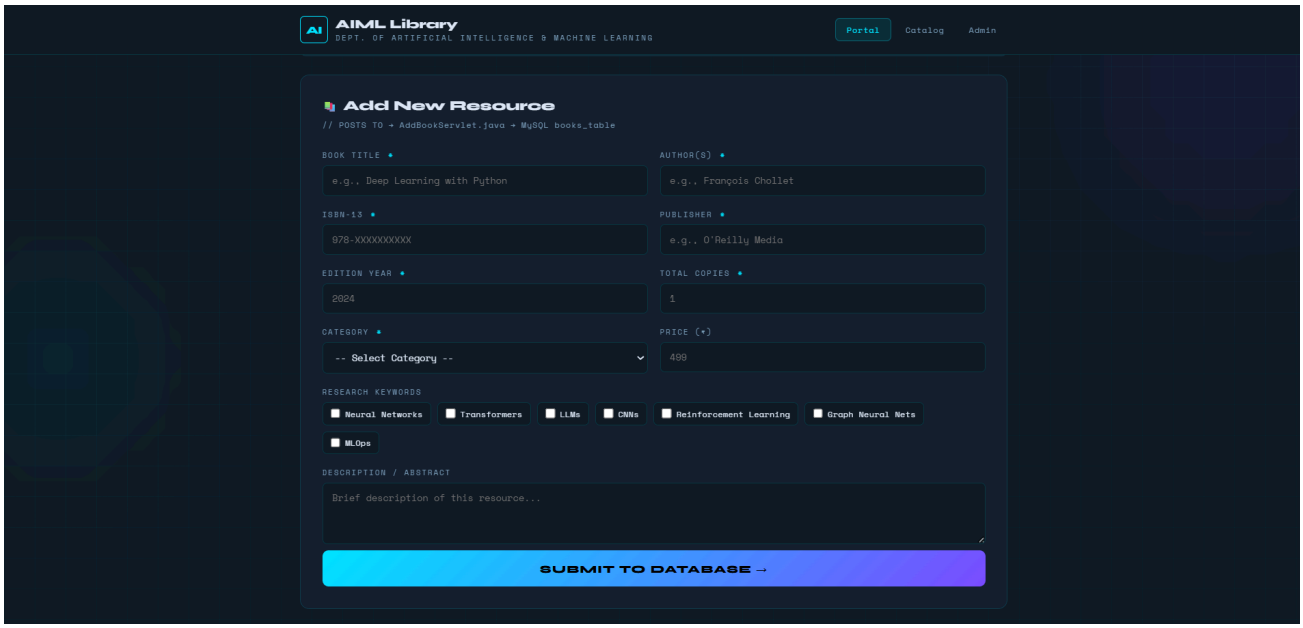
                // Change text color
                textView.setTextColor(Color.RED);

                // Change font style
```

```
            textView.setTypeface(null, Typeface.BOLD_ITALIC);

            // Show Toast message
            Toast.makeText(MainActivity.this,
                    "Font and Color Changed!",
                    Toast.LENGTH_SHORT).show();
        }
    });
}
}
```

Output:



Result:

Thus, the Library Management System with JavaScript validation and database connectivity using Servlet and JSP was successfully developed and executed.
